Session 5.1 Scaling up Interactive Data Analysis in Jupyter Lab: From Laptop to HPC

SDSC Summer Institute 2024

Peter Rose (pwrose@ucsd.edu)
Director, Structural Bioinformatics Lab

COMPUTING WITHOUT BOUNDARIES

EXPANSE

SAN DIEGO SUPERCOMPUTER CENTER

UNIVERSITY OF CALIFORNIA SAN DIEGO

Outline

- When to run on Expanse
- Setup a portable and reproducible software environment
- Scale up calculations on CPU/GPU using Dataframes
- Run Jupyter Lab in Batch
- Get ready to use Expanse: accounts, allocations
- Best Practices for Authoring Jupyter Notebooks

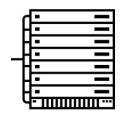

When to run on Expanse

Laptop/Desktop

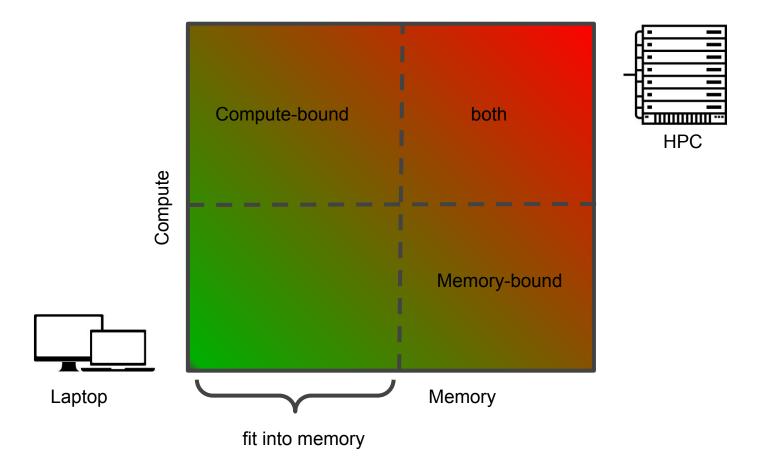

- Coding
- Exploratory phase
- Small datasets
- Run on single or few cores

Expanse

- Scaling up to
 - large datasets
 - long runtimes
- Run on many cores
- Run on GPUs

Expanse Nodes

128 CPU cores/node

4 GPUs, 40 CPU cores/node

	Compute Nodes		GPU Nodes
CPU Type	AMD EPYC 7742	GPU Type	NVIDIA V100 SMX2
Nodes	728	Nodes	52
Sockets	2	GPUs/node	4
		CPU Type	Xeon Gold 6248
Cores/socket	64	Cores/socket	20
Clock speed	2.25 GHz	Sockets	2
Flop speed	4608 GFlop/s	Clock speed	2.5 GHz
Memory capacity	* 256 GB DDR4 DRAM	Flop speed	34.4 TFlop/s
, , , , , , , , ,		Memory capacity	*384 GB DDR4 DRAM
Local Storage	1TB Intel P4510 NVMe PCle SSD	Local Storage	1.6TB Samsung PM1745b NVMe PCle SSD
Max CPU Memory bandwidth	409.5 GB/s	Max CPU Memory bandwidth	281.6 GB/s

	Partition Name	Max Walltime	Max Nodes/Job	Max Running Jobs	Max Running + Queued Jobs	Charge Factor	Notes
	compute	48 hrs	32	32	64	1	Exclusive access to regular compute nodes; limit applies per group
_	ind- compute	48 hrs	32	32	64	1	Exclusive access to Industry compute nodes; limit applies per group
Jupyter Notebook (CPU) ———	shared	48 hrs	1	4096	4096	1	Single-node jobs using fewer than 128 cores
	ind-shared	48 hrs	1	32	64	1	Single-node Industry jobs using fewer than 128 cores
	gpu	48 hrs	4	4	8 (32 Tres GPU)	1	Used for exclusive access to the GPU nodes
	ind-gpu	48 hrs	4	4	8 (32 Tres GPU)	1	Exclusive access to the Industry GPU nodes
Jupyter Notebook (GPU)	gpu-shared	48 hrs	1	24	24 (24 Tres GPU)	1	Single-node job using fewer than 4 GPUs
	ind-gpu- shared	48 hrs	1	24	24 (24 Tres GPU)	1	Single-node job using fewer than 4 Industry GPUs
	large- shared	48 hrs	1	1	4	1	Single-node jobs using large memory up to 2 TB (minimum memory required 256G)
Testing (CPU)	debug	30 min	2	1	2	1	Priority access to shared nodes set aside for testing of jobs with short walltime and limited resources
Testing (GPU) ———	gpu-debug	30 min	2	1	2	1	Priority access to gpu-shared nodes set aside for testing of jobs with short walltime and limited resources; max two gpus per job
	preempt	7 days	32		128	.8	Non-refundable discounted jobs to run on free nodes that can be pre-empted by jobs submitted to any other queue
	gpu- preempt	7 days	1		24 (24 Tres GPU)	.8	Non-refundable discounted jobs to run on unallocated nodes that can be pre-empted by higher priority queues

Setup a portable and reproducible software environment

Reproducibility*

obtaining consistent results using

same input data or parameters

same computational steps, methods, and code

same analysis conditions

Reusability

obtaining **new** results using

different input data or parameters

same computational steps, methods, and code

same analysis conditions

Scalability

obtaining **new** results using

large input data or parameter sets

same computational steps, methods, and code

same analysis conditions

^{*} L. Barba, https://figshare.com/articles/Next_in_Reproducibility_standards_policies_infrastructure_and_human_factors/8194328/1

Tools and Infrastructure

Computational notebooks: combine documentation, code, and results

Version-control system source code

Source code

Open-source package and environment management system

Container that packages software and OS in a portable way

Scalable compute infrastructure

Reproducible Environments

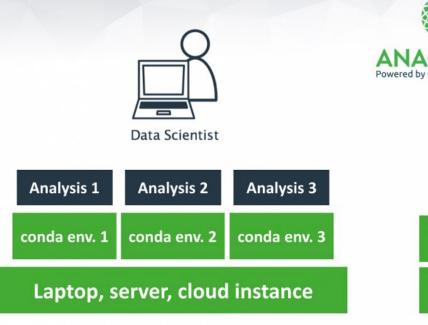

CONDA

- Beginner
- Experience with Conda
- Exploratory development
- Frequently changing dependencies
- Easy to compose an environment with many dependencies
- Run on single node on Expanse
- Supported on Linux, Mac, Windows
- Run on native OS

- Advanced user
- Experience with containers
- Production environment
- Often setup for a single tool
- Optimized containers for Expanse
 - pytorch, tensorflow, ...
 - support for multi-node
- Supported on Linux
- Mac, Windows requires a VM
- Run on packaged OS, e.g. Ubuntu

Analysis 1	Analysis 2	Analysis 3			
conda env. 1 conda env. 2 conda env. 3					
Docker Container					
Laptop, server, cloud instance					

Data Science Development

Data Science Deployment

Source: https://medium.com/@patrickmichelberger/getting-started-with-anaconda-docker-b50a2c482139

Package management system

 Conda installs, runs, and updates open source packages (e.g., NumPy, Pandas) and their dependencies, while checking compatibility with all preexisting packages.

Environment management system

- Conda allows you to create, save, load and switch between multiple environments on your local computer, as well as share instructions for how to recreate that environment on a different computer.
- Multi-platform (Windows, MacOS, and Linux)
- Multi-language (Python, R, Ruby, Scala, Java, JavaScript, C/ C++, etc.)

Why Conda Environments?

pip install pandas pip install scikit-learn

Or

conda install pandas

conda install scikit-learn

Directly installing packages into your base environment will lead to version conflicts, errors, and non-reproducible results.

environment 1

python=3.7 pandas=0.25.0 scikit-learn=0.20.0 environment 2

python=3.9 pandas=1.2.4 scikit-learn=0.24.2

By creating conda environments, multiple versions of software packages can co-exists without interference.

Conda environments are portable and can be installed on multiple platforms.

Define a Conda Environment

Create an **environment.yml** file in the top level of a Git Repository (https://github.com/sbl-sdsc/df-parallel)

name: df-parallel Use the same name as your Git repository channels: conda-forge anaconda Specify the channels where to look for packages. Order matters! dependencies: The conda-forge channel has newer versions than anaconda. - python=3.10 - jupyterlab=4.0.1 - ipywidgets=8.0.6 - matplotlib=3.7.1 Specify ("pin") version number to ensure reproducibility and - seaborn=0.12.2 - papermill=2.3.4 compatibility. - dask=2023.3.2 - pyspark=3.4.0 - pyarrow=10.0.1 - openjdk=17.0.3 Specify non-Python packages (e.g., Java). variables: # SPARK conf directory with logging configuration SPARK_CONF_DIR: ../conf SPARK_DRIVER_MEMORY: 16G SPARK DRIVER MAXRESULTSIZE: 4G Set environment variables (e.g., configuration options). SPARK WORKER MEMORY: 4G

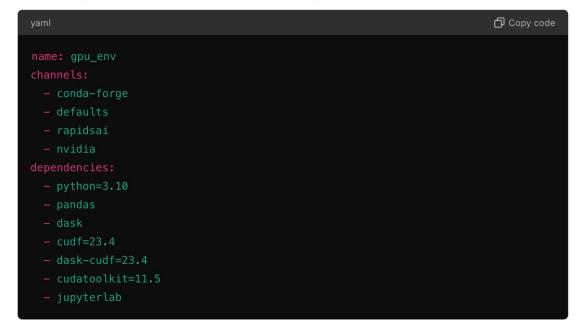

Define a Conda Environment with ChatGPT

Create a Conda environment.yml file for Python 3.10 and Jupyter Lab. Include the following packages: Pandas, Dask, cuDF, Dask-cuDF. Include any dependencies and channels required to run this

Tip:

on an NVIDIA GPU

If there are any errors, paste the error message into ChatGPT. It will try to correct its mistake. You may need to iterate a few times. Here is the `environment.yml` file for creating a Conda environment with Python 3.10 and Jupyter Lab, including the specified packages and dependencies for an NVIDIA GPU:

Create a Conda Environment

Prerequisite: Miniconda3 (light-weight, preferred) or Anaconda3 installed

https://docs.conda.io/en/latest/miniconda.html

Create a Conda environment

conda env create -f environment.yml
 or
mamba env create -f environment.yml (faster)

Activate a Conda environment

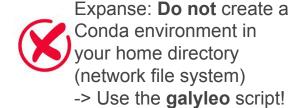

conda activate <environment_name>

Run Jupyter Lab

jupyter lab

Deactivate conda environment

conda deactivate

Example of using a Conda Environment on Expanse

Clone the Git repo

```
git clone https://github.com/sbl-sdsc/df-parallel.git
cd df-parallel
```

Run on CPU (Pandas, Dask, Spark dataframes)

```
galyleo launch --account <account_number> --partition shared --cpus 10 --memory 20
--time-limit 01:00:00 --conda-env df-parallel --conda-yml environment.yml --mamba
```

Run on GPU (cuDF, Dask-cuDF dataframes)

```
galyleo launch --account <account_number> --partition gpu-shared --cpus 10
--memory 92 --gpus 1 --time-limit 01:00:00 --conda-env df-parallel-gpu
--conda-yml environment-gpu.yml --mamba
```

1 GPU + 10 CPUs + 92 GB = 1/4 of a GPU node

Task 1 - Launch Jupyter Lab on Expanse using a Conda environment

- Clone df-parallel Git repository
- Start galyleo on a GPU node
- Paste the URL for your Jupyter Lab session into your browser

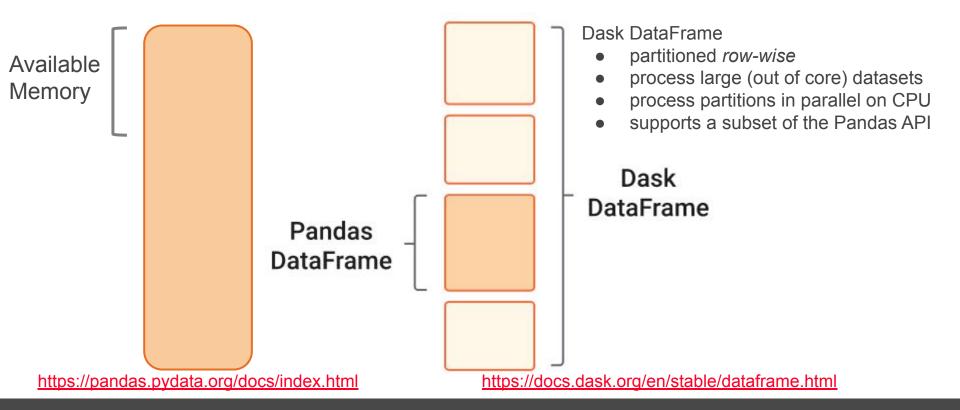

Follow the instructions for Task 1

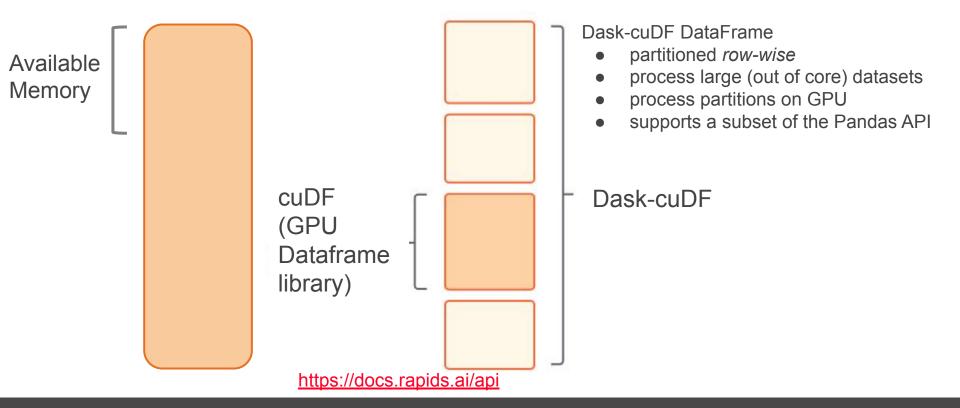

Scale up Calculations on CPU/GPU using Dataframes

Processing large Datasets on CPU

Processing large Datasets on GPU

Example Notebooks

https://github.com/sbl-sdsc/df-parallel

Dataframe Library	Parallel	Out-of-core	CPU/GPU	Evaluation
Pandas	no	no [1]	CPU	eager
Dask	yes	yes	CPU	lazy
Spark	yes	yes	CPU	lazy
cuDF	yes	no	GPU	eager
Dask-cuDF	yes	yes	GPU	lazy

[1] Pandas can read data in chunks, but they have to be processed independently.

Efficient File Formats

Columnar Storage Format - Parquet

@EmrgencyKittens

Query and space efficient file format (default: Snappy compression)

Vertical partitioning (projection push down)

 a
 b
 c

 a1
 b1
 c1

 a2
 b2
 c2

 a3
 b3
 c3

 a4
 b4
 c4

b5

+ Horizontal partitioning (predicate push down)

а	b	С
a1	b1	c1
a2	b2	c2
аЗ	b3	сЗ
a4	b4	с4
a5	b5	с5

Read only the data you need!

a	b	C
a1	b1	c1
a2	b2	c2
аЗ	b3	сЗ
a4	b4	с4
a5	b5	c5

Horizontal partitioning uses column min/max statistics from Parquet metadata.

https://www.slideshare.net/julienledem/if-you-have-your-own-columnar-format-stop-now-and-use-parquet

Creating Parquet "Files" with Dask

```
genes = dd.read_csv(input, dtype=str, sep="\t")
genes.to_parquet(output, write_index=False,
write_metadata_file=True, engine="pyarrow")
```

```
genes = dd.read_csv(input, dtype=str, sep="\t")
genes.to_parquet(output, write_index=False,
write_metadata_file=True, engine="pyarrow",
partition_on=["type_of_gene"])
```

```
[xdtr104@login02 ~]$ ls -lh gene_info.parquet/
total 1.2G
-rw-r--r-- 1 xdtr104 uic157
         20M Aug 4 10:14 part.12.parquet
4 10:14 part.15.parquet
-rw-r--r-- 1 xdtr104 uic157 18M Aug
-rw-r--r-- 1 xdtr104 uic157  20M Aug  4 10:14 part.16.parquet
         21M Aug 4 10:14 part.17.parquet
-rw-r--r-- 1 xdtr104 uic157
```

```
[xdtrl04@login02 ~]$ is -in gene_info.parquet/
total 698K
4 Aug 4 16:16 'type of gene=biological-region
drwxr-xr-x 2 xdtr104 uic157
                          68 Aug 4 16:15 'type of gene=miscRNA'
drwxr-xr-x 2 xdtr104 uic157
drwxr-xr-x 2 xdtr104 uic157
                          87 Aug
                                 4 16:15 'type of gene=ncRNA'
drwxr-xr-x 2 xdtr104 uic157
                                4 16:15 'type of gene=other'
                                4 16:15 'type of gene=protein-coding'
drwxr-xr-x 2 xdtr104 uic157
drwxr-xr-x 2 xdtr104 uic157
                                 4 16:15 'type of gene=pseudo'
                                 4 16:15 'type_of_gene=rRNA'
drwxr-xr-x 2 xdtr104 uic157
drwxr-xr-x 2 xdtr104 uic157
                           5 Aug 4 16:16 'type of gene=scRNA'
drwxr-xr-x 2 xdtr104 uic157
                                 4 16:15 'type of gene=snRNA'
                                 4 16:16 'type of gene=snoRNA'
drwxr-xr-x 2 xdtr104 uic157
drwxr-xr-x 2 xdtr104 uic157
                                 4 16:15 'type of gene=tRNA'
                                4 16:16 'type of gene=unknown'
drwxr-xr-x 2 xdtr104 uic157
```

Parquet files are typically directories of files.

 Parquet files can be partitioned by one or more columns for query efficiency.

Vertical & Horizontal Partitioning

```
# vertical partitioning
column names = ["GeneID", "Symbol", "Synonyms", "description", "type of gene", "#tax id", "chromosome"]
# horizontal partitioning (conditions can be nested for complex filters)
filters=[[("type_of_gene", "==", "protein-coding")]]
# Pandas
genes = pd.read parquet(filename, columns=column names, filters=filters)
# Dask
genes = dd.read parquet(filename, columns=column names, filters=filters)
# cuDF
genes = cudf.read parquet(filename, columns=column names, filters=filters)
# Dask-cuDF
genes = dask_cudf.read_parquet(filename, columns=column names, filters=filters)
# Spark
genes = spark.read.parquet(filename)
genes = genes.select(column names)
genes = genes.filter("type of gene == 'protein-coding'")
```

Benchmark Dataframe Libraries

TASK 2: Benchmark Dataframe Libraries using a csv Input File

 TASK 3: Benchmark Dataframe Libraries using a Parquet Input File

TASK 4: Measure Parallel Efficiency

Dataframe Benchmark

Results for running on SDSC Expanse GPU node with 10 CPU cores (Intel Xeon Gold 6248 2.5 GHz), 1 GPU (NVIDIA V100 SMX2), and 92 GB of memory (DDR4 DRAM), local storage (1.6 TB Samsung PM1745b NVMe PCle SSD).

Datafile size (gene_info.tsv):

• Dataset 1: 5.4 GB (18 GB in Pandas)

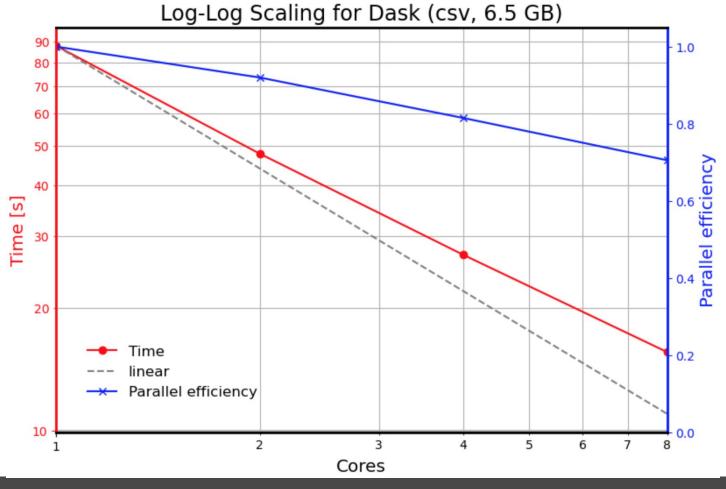

• Dataset 2: 21.4 GB (4 x Dataset 1) (62.4 GB in Pandas)

Dataset 3: 43.7 GB (8 x Dataset 1)

Dataframe Library	time(5.4 GB) (s)	time(21.4 GB) (s)	time(43.7 GB) (s)	Parallel	Out- of- core	CPU/GPU
Pandas	56.3	222.4	[2]	no	no	CPU
Dask	15.7	42.1	121.8	yes	yes	CPU
Spark	14.2	31.2	56.5	yes	yes	CPU
cuDF	3.2	[2]	[2]	yes	no	GPU
Dask-cuDF	7.3	11.9	19.0	yes	yes	GPU

[2] out of memory

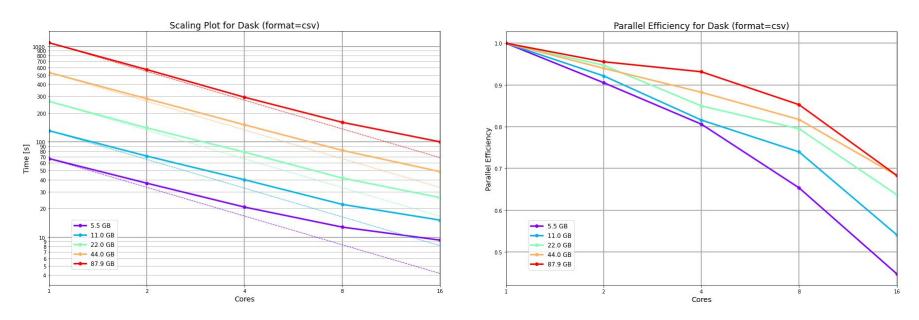

Scaling for Dask Dataframe

Runtime as function of dataset size and number of cores

Batch benchmark: slurm script: <u>benchmark.sb</u> notebook: <u>8-BenchmarkSummary.ipynb</u>

Run Jupyter Lab in Batch

Run Jupyter Lab in Batch

Example batch file

https://github.com/sbl-sdsc/df-parallel/blob/main/solution.sh

Submit job sbatch solution.sh

Papermill (https://papermill.readthedocs.io/en/latest/)

execute notebook on the command line
 papermill input.ipynb output.ipynb

execute notebook in Python

```
import papermill as pm
pm.execute_notebook("input.ipynb", "output.ipynb")
```

parameterize notebook (pass arguments to Jupyter Notebooks)

papermill input.ipynb output.ipynb -p variable1 value1 -p variable2 value2

Get ready to use Expanse: accounts, allocations

Expanse Allocation

- Trial allocation: 100 GPU and/or 1000 CPU hours consult@sdsc.edu
- Apply for allocations through <u>ACCESS</u>
 - **EXPLORE** (400K) Great for resource evaluation, graduate student projects, small classes and training events, benchmarking, code development and porting, and similar small-scale uses.
 - DISCOVER (1.5M) Designed for research grants with modest resource needs, Campus
 Champions, large classes and training events, NSF graduate fellowships, benchmarking and code testing at scale, and gateway development.
 - ACCELERATE (3M) Best for experienced users with mid-scale resource needs, consolidating multi-grant programs, collaborative projects, preparing for Maximize ACCESS requests, and gateways with growing communities.
 - MAXIMIZE (>3M) The choice for large-scale research activities that need more resources than the limit for Accelerate ACCESS projects.

Best Practices for Authoring Jupyter Notebooks

Tools to Support Reproducible Workflows

Organizing and Documenting

- Rule 1: Tell a Story for an Audience
 - Beginning introduce topic
 - Middle describe steps
 - End interprets results
 - Describe not just what you did, by why you did it, how the steps are connected, and what it all means.
 - Adjust your description depending on the intended audience
- Rule 2: Document the process, not just the results
 - Add descriptive notes, e.g., why a particular parameter was chosen
- Rule 3: Use cell divisions to make steps clear
 - Avoid long cells
 - Limit each cell to one meaningful step
 - Split long notebooks into a series of notebooks
 - Keep a top-level index notebook with links to the individual notebooks

Working with Code

Record Working with code

Simplified Notebook Cycle

Organizing and documenting

Read, Run, Explore

- Rule 4: Modularize Code
 - Use functions instead of duplicating code cells
- Rule 5: Record Dependencies
 - Manage your dependencies explicitly from the start using a tool such as
 - Conda's environment.yml
 - pip's requirements.txt
- Rule 6: Use Version Control
 - Consider using a public repository from the beginning of a project
 - Tie research results to specific software versions
- Rule 7: Build a Pipeline
 - Design notebooks with reuse in mind (different input data and parameters)
 - Define key input data and parameters at the top of each notebook
 - Break long notebooks into smaller notebooks that focus on one or a few analysis steps.

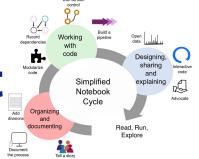

Sharing, explaining

- Rule 8: Share and Explain Your Data
 - Share your data in a repository with a persistent identifier, e.g., DOI
 - Bio repositories, e.g., NCBI, Ensemble, PDB
 - General repositories, e.g., Zenodo https://zenodo.org/
 - Small datasets can be stored in GitHub with your source code (< 50MB)
 - E.g., in a /data folder
 - Very large datasets
 - Consider using a sample of the data and a link to the original data
 - Save intermediate data after data processing
 - E.g., in /intermediate_data folder
 - Can be used to verify each step in a workflow

Sharing, explaining cont

- Rule 9: Design your notebooks to be read, run, and explored
 - Git repository
 - Add a descriptive README file
 - Add a LICENCE file (liberal licence, e.g., MIT, Apache 2)
 - Add a static HTML/PDF file of your notebooks for long-term preservation
 - Add Binder badge/link to launch notebooks in the cloud (https://mybinder.org/)
 - Consider using ipywidgets to add menus or sliders to enable interactive exploration of parameters

Sharing, explaining cont.

- Rule 10: Advocate for open research
 - Apply what you learned in this tutorial in your own research and be an advocate for open and reproducible research in your lab or workplace
 - Publish a fully reproducible paper! Create all figures, data tables, and all other computational results using Jupyter Notebook and deposit in Github.

Our lab's moving to this model: publish "static PDF" papers as expected, but also a shadow, interactive @ProjectJupyter version alongside that has all code to process, analyze, and visualize data.

"The Scientific Paper Is Obsolete" featuring @fperez_org

The Scientific Paper Is Obsolete

Here's what's next.

theatlantic.com

Summary

- When to run on Expanse
- Setup a portable and reproducible software environment
- Scale up calculations on CPU/GPU using Dataframes
- Run Jupyter Lab in Batch
- Get ready to use Expanse: accounts, allocations
